COMMENT

Dimensions in this technical documentation are given in inches (mm).

General tolerances according to DIN ISO 2768-cl apply.

GENERAL

An advantage for best heating, cooling, drying, air sweeping

Many production processes require a linear extended and absolutely even distribution of air or other gases to the working area.

Because of their special design, tangential fans meet these requirements especially well.

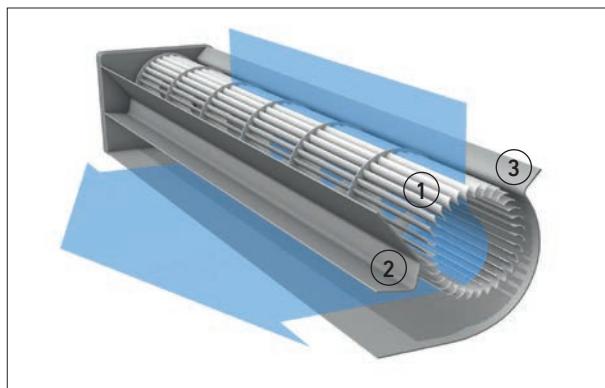

The rigid design and the use of high quality materials secure a long service life.

The working principle that does away with the need for additional baffles and vanes and the space saving design makes the use of tangential fans very economical.

FLOW PRINCIPLE

The air intake of tangential fans takes place over the whole length of the outer impeller periphery. The air then flows into the impeller interior where it is reversed and accelerated by the vortex caused by the impeller rotation. Finally the air is distributed at the discharge side over the whole impeller length. In this way the air flows through the impeller first from outside to inside and then from inside to outside. The impeller is a cylindrical cage of forward curved impeller blades with two or more supporting discs

The vortex separates suction side and discharge side at the narrowest line between impeller ① and vortex inducer ② and causes the flow pattern together with the scroll ③.

① Impeller
② Vortex inducer
③ Fan scroll

ADVANTAGES

- Uniform air flow over the entire fan width. Additional baffles, plenums and guide vanes are not required.
- Space saving due to a 90° or 180° airflow deflection.
- The fan width can be exactly matched to the machine width. The air flow pattern does not change with wider machines (simplifies design and drawings of modular systems).
- Works equally well in any arrangement (right hand drive or left hand drive available).
- Low noise operation due to aerodynamic design of casing and impeller.
- Long life expectancy due to the robust design and location of impeller bearings out of the air flow.
- Many bolt-on options.

APPLICATION OF LTG HIGH PERFORMANCE TANGENTIAL FANS

Agricultural technology, air conditioning technology, apparatus engineering, automotive industry, bakery technology, biomedical industry, building material industry, chemical industry, cleaning technology, control panel technology, dedusting technology, drying technology, electronic industry, environmental simulations, food industry, furnace technology, heat treatment technology, mechanical and plant engineering, medical technology, packaging industry, paper industry, pharmaceutical industry, power plant engineering, process engineering, railway technology, refrigeration technology, store design, surface technology, swimming pool technology, textile machinery design, tobacco industry, transportation cooling, wood industry...

POSITION OF THE FAN

Standard arrangement is horizontal. With vertical arrangement the drive motor has to be at the bottom.

INSTALLATION AND START UP

Mount the fans to a plane base frame without any distortion. Utilize only the bolt holes in the side elements. Make sure to observe the applicable safety codes before starting the fans.

MOTOR ARRANGEMENT

With the suction opening on top and viewing the discharge opening the driving motor is either on the right hand or the left hand side.

DIMENSIONS

SPECIFICATION AND DESIGN FEATURES

Tangential fan with close coupled, spray water protected drive motor.

Motor right hand side = TARh, motor left hand side = TALh

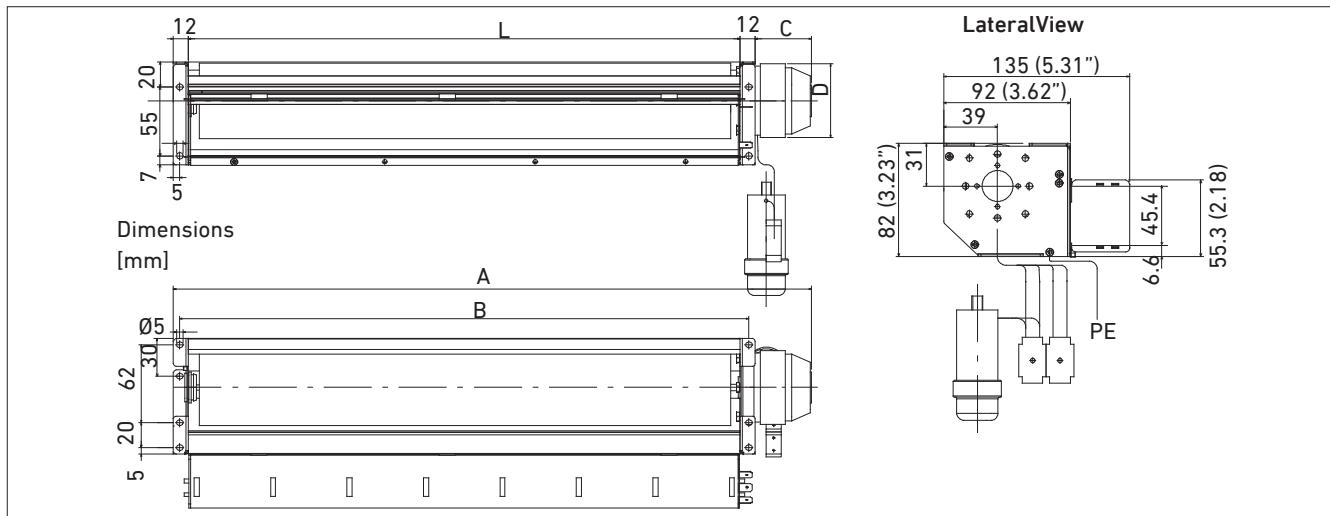

Corrosion proof impeller and rigid bolted casing. Impeller and casing in aluminum.

On the drive side the impeller is supported by an elastic coupling on the motor shaft. On the counter side the impeller is supported by vibration damped ball bearings. Bearing design life is 20 000 hours.

Low noise operation due to the aerodynamic design of the casing and impeller. The heating elements are provided with over-heat protection and may be connected as shown in the chart (see next page). Motor connection according to the wiring diagram on page 17.

The following drive types are possible:

TA h 60/.../US	Motor 115 V / 50 Hz / 60 Hz
TA h 60/.../N	Motor 230 V / 50 Hz
TA h 60/.../24 V DC	Motor 24 V (16 V - 28 V) speed control by control voltage see wiring diagram.

TYPE TA h WITH HEATING ELEMENT, IMPELLER DIAMETER 2.4" (60 MM)

WIRING DIAGRAM - HEATING ELEMENT

The thermostat will switch off the heating element whenever the standard limit is exceeded and resume operation when dropping below.

Attention: The thermostat is for self protection of heating. Do not use it for control and safety purposes! They must be ensured through external measures on site by the customer.

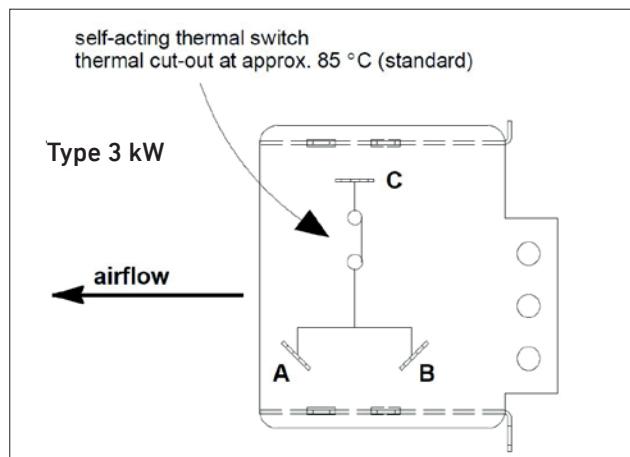

Supply voltage: 115 V AC or 230 V AC

All performance data apply to a supply voltage of 230 V AC.

Note: Thermoswitch listed separately

TYPE TE t, IMPELLER DIAMETER 2.4" (60 MM)

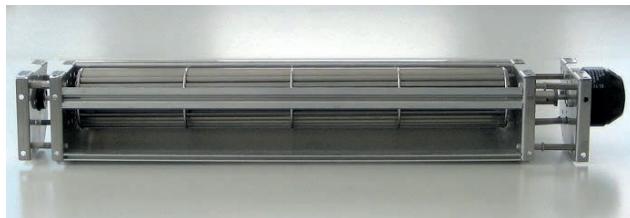

Fig.: Tangential fan type TEt 60 (motor right hand side)

SERVICE CONDITIONS

Gas temperatures:

-40 up to +570 °F (-40 up to +300 °C)

Ambient temperatures:

Drive side with motor: -13 up to +105 °F (-25 up to +40 °C)

Counter side: -40 up to +160 °F (-40 up to +70 °C)

Caution! If necessary, additional convection cooling between the side elements is required!

SPECIFICATION AND DESIGN FEATURES

Tangential fan with close coupled, spray water protected drive motor. Motor right hand side = TERt, motor left hand side = TELt Rigid bolted, corrosion proof casing of marine grade aluminum. Impeller, spacers, shaft flange and side elements of stainless steel. On the drive side the impeller is supported by an elastic coupling on the motor shaft. On the counter side, a ceramic shaft is used and it is mounted in the outer side portion. The motor and opposite side ball bearings have a minimum service life of 20 000 hours.

Discharge openings have sealing planes to connect exactly to ducts and appliances.

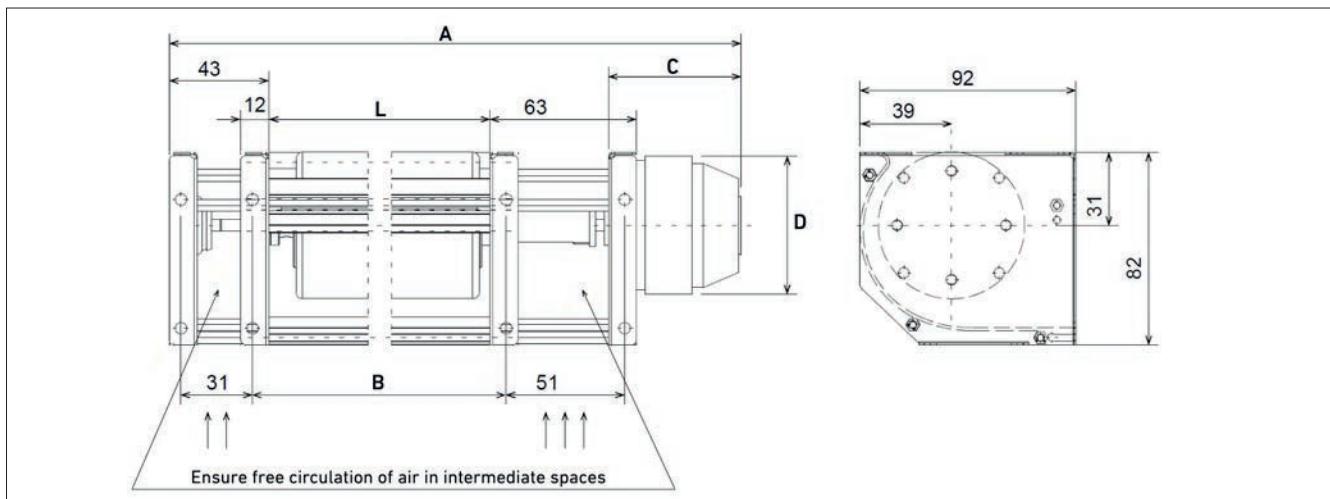

Low noise operation due to the aerodynamic design of the casing and impeller.

Motor connection according to the wiring diagram on page 17.

The following drive types are possible:

TE t 60/.../N	Motor 230 V / 50 Hz
TE t 60/.../24 V DC	Motor 24 V (16 V - 28 V) speed control by control voltage see wiring diagram.
TE t 60/.../US	Motor 115 V / 50 Hz / 60 Hz

FAN CURVES - IMPLEMENTATION N

The indicated curves are valid for an air density of $\rho = 1,2 \text{ kg/m}^3$, if operated with standard motor 230 V / 50 Hz.

The rating tests were done as laboratory tests according to EN ISO 5801:2008 with unrestricted inlet and discharge.

Measuring tolerances for $\Delta p: \pm 0.008 \text{ "wg}$ ($\pm 2 \text{ Pa}$);

Measuring tolerances for $L_{WA}: \pm 2 \text{ dB(A)}$

ACOUSTICAL DATA

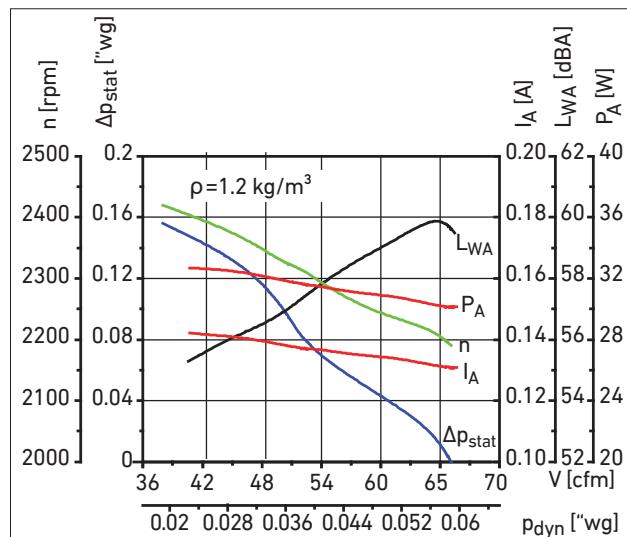

The acoustical data are for discharge side, tested in a reverberant field.

The A-weighted sound power level L_{WA} can be transformed into an A-weighted sound pressure level by the equation $L_{PA} = L_{WA} - 10 \lg S/1 \text{ m}^2$.

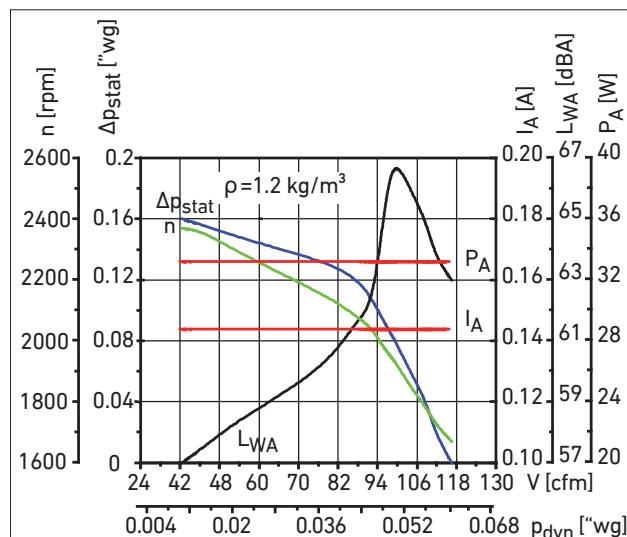

For this the exact total panel area S can be used.

The sound pressure level in the free field in 1 m distance (full spheric sound radiation) is abt. 11 dB less than the sound power level.

ELECTRICAL CONNECTIONS A/C MOTOR

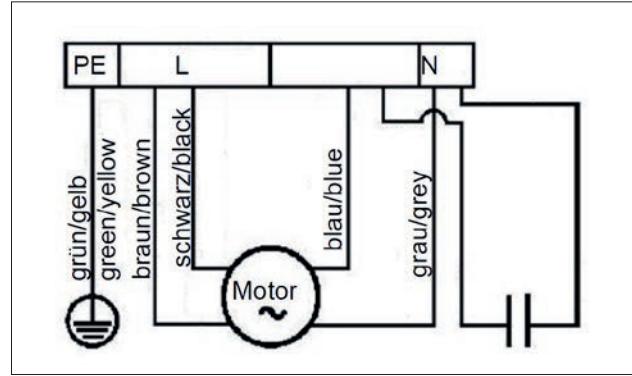

Driven by single-phase capacitor motor, 4-pole version,
 $U = 115 \text{ V}, f = 50 \text{ Hz} / 60 \text{ Hz}$ or $U = 230 \text{ V}, f = 50 \text{ Hz}$.

The motor is completely wired to the operating capacitor and provided with terminals (protection IP 10).

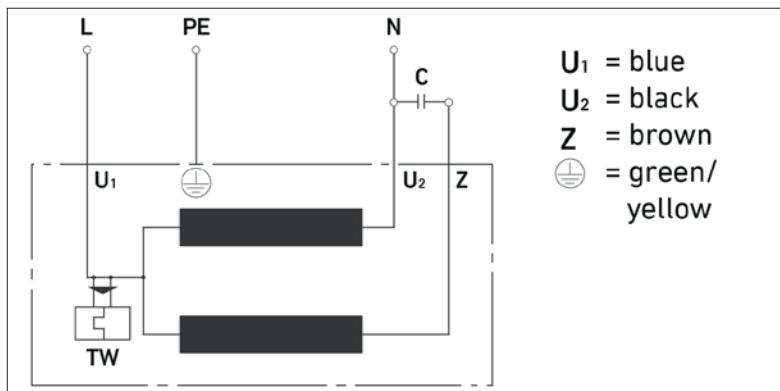

Wiring diagram

Wiring diagram TAR/TER ... N/US

Wiring diagram TAL/TEL ... N/US

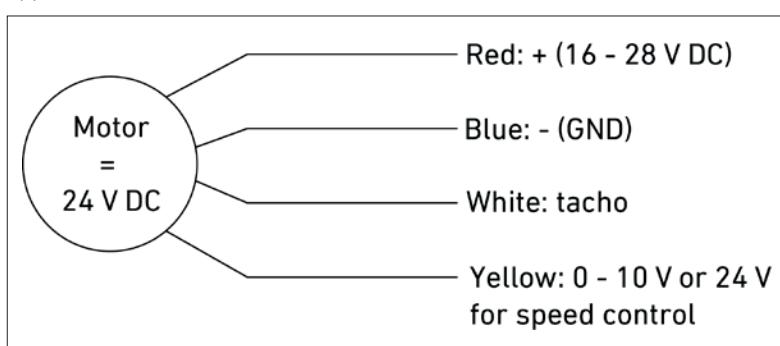

Wiring diagram TAR/TER ... 2p

ELECTRICAL CONNECTIONS D/C MOTOR

For speed control, a control signal may be connected to the yellow cable. An applied DC voltage of 0 V DC results in a motor speed of 0 rpm and 10 V DC is rated speed. For continuous operation at rated speed, a voltage of 24 V AC should be applied.

Connecting lead when supplied with 4-pole connector housing (Stocko EH 716-004-003-960) with the following configuration:
 1=red / 2=white / 3=yellow / 4=blue.

Matching mating connector housing also included in supply.
